CERTIFICATE

Certified that the Internship Work title **INFORMATION TECHNOLOGY INTERN** was carried out by **Mr. AKHIL SHETTY M** bearing **USN 4SO21CS013**, a bonafide student of final year B.E. in partial fulfillment for the award of Bachelor of Engineering in Computer Science and Engineering of St Joseph Engineering college , during the year 2024-25. Further, it is certified that all corrections/suggestions indicated during Internal Evaluation have been incorporated in this report.

TO WHOMSOEVER IT MAY CONCERN

This is to confirm that Mr. Akhil Shetty is undergoing an internship in our organization and his learning is on the Web Applications. His period of internship is from 3rd February 2025 to 30th May 2025.

So far, he has exhibited his strengths by motivating himself to master new skills. His performance exceeded our expectations, and he has managed to complete the assignments on time.

We wish him much success in his future endeavors

Yours Sincerely,

Anshu Dasgupta
Director HR
GIC Global Industrial Private Limited.

DECLARATION

I, **AKHIL SHETTY M**, bearing **USN 4SO21CS013**, a student of final year B.E. in Computer Science and Engineering at St Joseph Engineering College, Mangaluru, hereby declare that the Internship Work titled “**INFORMATION TECHNOLOGY INTERN**” has been duly carried out by me from **03-02-2025** to **16-05-2025** at **GLOBAL INDUSTRIAL PRIVATE LIMITED**, Andheri–Kurla Road, Gamdevi, Marol, Andheri East, Mumbai, Maharashtra – 400059. Furthermore, the “Tasks Performed” section of this report accurately represents the work completed solely by me and does not contain any statements misrepresenting others’ work as my own.

Date: 16 May 2025

Place: Mangaluru

Akhil Shetty M

ACKNOWLEDGEMENT

The joy and satisfaction that accompany the successful completion of any task would be incomplete without thanking those who made it possible. I consider myself proud to be a part of St Joseph Engineering College, the institution which moulded me in all my endeavours. I express my sincere gratitude to the management for providing the state of art facilities and support for the smooth completion of the Internship.

I would like to offer my earnest gratitude to my external guide, **Mr. Satyasurya Benarji**, Manager, Global Industrial Private Limited, for providing me valuable support throughout the period of my internship.

I would like to offer my earnest gratitude to my internal guide, **Dr. Sridevi Saralaya**, Professor , Dept. of Computer Science & Engineering, St Joseph Engineering College for her valuable guidance and support during the entire period of my internship.

I am grateful to **Dr Sridevi Saralaya**, Head of the Department, Computer Science and Engineering, for her support and encouragement.

Sincere thanks to **Dr Rio D'Souza**, our Principal, for guidance and valuable suggestions, and to **Rev Fr Kenneth Crasta** and **Rev Fr Wilfred P D'Souza** for providing facilities and ensuring timely completion.

I wish to express my sincere gratitude to all the Faculty and Technical staff of the Department and friends and family for their valuable help and support during the period of my internship.

Executive Summary

From February 3 to May 16, 2025, I interned as a Software Development Intern at Global Industrial Private Limited, a leading North American industrial supply company. I started with onboarding, environment setup, and tool introductions, then quickly learned HTML, CSS, and JavaScript to build responsive and interactive web interfaces.

As I progressed, I strengthened my understanding of Java and React, creating projects like ProReact and Weathery to apply concepts such as state management, hooks, and real-time data handling. I also explored Next.js for server-side rendering and dynamic routing. Additionally, I developed projects like NodeSurge and Promptlytic, which helped me build full-featured front-end applications and deepen my understanding of modern web development practices.

A major part of my internship involved working on the company website. I contributed by resolving UI bugs and feature issues raised through the internal ticketing system. Tickets included fixes like hiding modals for logged-in users, improving wishlist behavior, and role-based field visibility. I created clean, isolated Git branches for each fix, raised PRs, and ensured they were successfully reviewed and merged into the main codebase, following best practices in collaborative development.

On the backend, I was introduced to the basics of Java Servlets, JSP, and JDBC, learning how web applications manage sessions, handle data, and connect to databases. I also worked with tools like MongoDB and deployed applications using Vercel, building a solid understanding of both front-end and back-end workflows.

This internship gave me valuable exposure to real-world development practices, including working with version control systems, debugging live issues, and collaborating with a team through ticket-based assignments. The mentorship and responsibilities helped me grow technically and professionally, preparing me for future roles in full-stack development.

- Akhil Shetty M

Chapter 1

About the Company

1.1 Brief History

Global Industrial Company, originally founded as Global Equipment Company in 1949, has grown into a leading value-added industrial distributor with over 75 years of industry expertise. Headquartered in Port Washington, New York, the company operates in the U.S. and Canada under the Global Industrial brand, serving small to medium-sized companies (SMC), enterprise businesses, and the public sector (including federal, state, and local governments, as well as schools).

Global Industrial offers a wide range of industrial-strength products across 21 prime categories, including material handling, storage & shelving, safety & security, janitorial & facility maintenance, and HVAC & fans. The company supplies businesses across North America, providing products from well-known national brands and its own line of Global Industrial Exclusive Brands™.

With a strong focus on customer-first service, product expertise, and innovative solutions, Global Industrial continues to deliver value and efficiency to businesses of all sizes.

1.2 Overview of the Company Operation

- **Products and Services:** Global Industrial is a leading industrial distributor that offers a comprehensive range of industrial-strength products across 21 prime categories. These include material handling, storage shelving, safety security, janitorial facility maintenance, and HVAC fans. The company sources products from well-known national brands and also provides its own line of Global Industrial Exclusive Brands™. With over hundreds of thousands of products, Global Industrial ensures that

businesses have access to the right tools and equipment to optimize their operations.

- **Business Model:** Global Industrial operates as a value-added industrial distributor, delivering solutions to small to medium-sized companies (SMC), enterprise businesses, and the public sector (including federal, state, and local governments and schools). The company engages customers through dedicated relationship marketers and proprietary e-commerce websites, ensuring a seamless and efficient purchasing experience.
- **Market Position:** Global Industrial is a recognized leader in the industrial distribution sector with over 75 years of expertise. Headquartered in Port Washington, New York, the company operates under the Global Industrial brand in the United States and Canada. Its extensive product selection, customer-centric approach, and deep industry knowledge have solidified its position as a trusted partner for businesses of all sizes across North America.
- **Growth and Future:** Founded in 1949 as Global Equipment Company, Global Industrial has grown to become a key player in the industrial distribution market. The company continues to leverage its extensive product knowledge and innovative solutions to address evolving customer needs. By combining a customer-first approach with operational efficiency, Global Industrial aims to drive future growth, expand its product offerings, and strengthen its position as a market leader in the industrial distribution sector.

Chapter 2

About the Department

2.1 Introduction

Our department focuses on UI/UX designing and full-stack development, where we specialize in developing and enhancing the company's website. The department includes experienced and certified developers, and all students are encouraged to participate. We cover all the necessary fundamentals, ensuring that the required tools and software are properly installed and configured. Dedicated time is allocated for learning and completing assigned tasks, with professional guidance available whenever needed to resolve any challenges.

2.2 Roles and Responsibility

At the onset of my internship at Global Industrial, I was assigned a range of responsibilities aimed at building both foundational and advanced skills in full-stack software development. These tasks were structured to provide practical exposure to real-world workflows, enhance my problem-solving capabilities, and prepare me for professional collaboration in an industrial environment.

- **Development and Implementation:** I was expected to design and implement dynamic front-end components using HTML, CSS, JavaScript, and React. Emphasis was placed on writing clean, reusable code while ensuring cross-browser compatibility and responsiveness.
- **Java and Backend Development:** I was assigned backend development tasks using Java, focusing on object-oriented programming concepts, exception handling, and

collections. I was also expected to gain hands-on experience with Servlets, JSP, JDBC, and the Struts framework for full-stack development.

- **Real-Time Application Building:** One of the core responsibilities included developing real-time applications that integrated external APIs. I was expected to build projects like a chatbot and a weather application that used modern frontend frameworks and real-time data fetching strategies.
- **Project Ownership and Deployment:** I was given ownership of independent full-stack projects, including planning, development, testing, and deployment. This included handling platform compatibility, implementing features like authentication, and deploying using services like Vercel or Firebase.
- **Ticket-Based Development:** I was expected to contribute to internal product development by picking up real-world bug tickets and feature enhancements. This included UI bug fixes, conditional rendering logic, and merging production-ready code via Bitbucket repositories.
- **UI Optimization and Code Refactoring:** Part of my role was to identify and fix UI inconsistencies, improve loading performance, and refactor existing codebases to follow best practices and improve maintainability.
- **Reporting and Collaboration:** I was required to maintain consistent communication with mentors, report daily progress, participate in code reviews, and follow version control protocols. Feedback incorporation and documentation were integral to this responsibility.
- **Training and Continuous Learning:** I was encouraged to attend internal training sessions and apply the learning to ongoing projects. I was expected to stay updated with modern technologies, frameworks, and deployment strategies throughout the internship.

Chapter 3

Task Performed

3.1 Weekly Report

3.1.1 Week 1: Onboarding and Mastering HTML, CSS, and JS

In the first week of my internship, I was introduced to the company's structure, team dynamics, and ongoing projects through a detailed orientation session. After completing the onboarding process, including setting up my official email and accessing internal platforms, I focused on front-end development. I learned HTML basics by creating structured web pages with forms, tables, and lists. I applied CSS using Grid and Flexbox for responsive layouts. Midweek, I worked on the Global Industrial Company (GIC) website, developing the homepage, product listing, product detail, contact form, and shopping cart pages. Towards the end of the week, I used JavaScript to add interactivity, including dynamic shopping cart updates and form validation. This week strengthened my front-end skills and enhanced my ability to build responsive, functional web pages.

3.1.2 Week 2: Strengthening Java and React Skills

In my second week, I focused on improving my Java and React skills. I started with Java basics, covering syntax, variables, data types, and type casting while practicing arithmetic operations and input handling. I explored control flow using loops and conditional statements to solve pattern-based problems. Midweek, I learned Object-Oriented Programming (OOP) concepts like encapsulation, inheritance, and polymorphism by creating Java programs with classes and methods. I then transitioned to React, where I built a basic app using functional components, props, and state management with the useState hook. I also started developing ProReact, a text utility app with case conversion, whitespace removal,

and reading time estimation using React Hooks and Bootstrap. This week strengthened my understanding of Java's OOP principles and enhanced my confidence in React development.

3.1.3 Week 3: Advanced Java and React Development

In the third week of my internship, I focused on deploying ProReact and advancing my Java and React skills. I finalized and deployed ProReact, ensuring smooth performance across devices and browsers. I then worked on an advanced JavaScript and React task covering closures, async/await, higher-order functions, lifecycle methods, context API, and optimizations like memoization and lazy loading. Midweek, I explored inheritance and polymorphism in Java, implementing parent-child relationships and method overloading/overriding. I also learned about inner classes, enums, and wrapper classes, improving code organization and type safety. Toward the end of the week, I practiced user input handling, the date/time API, and static/final keywords through exercises. The week concluded with a test on all covered topics, where I performed well but identified areas for further improvement.

3.1.4 Week 4: Advancing Java Proficiency and Building Real-Time React Applications

In the fourth week, I focused on mastering advanced Java concepts and developing the Weathery app. I started with dynamic data structures like ArrayList and LinkedList, practicing adding, removing, and iterating elements. I then explored HashMap and HashSet for key-value storage and unique element handling, using iterators for efficient iteration. Midweek, I learned sorting techniques with Comparable and Comparator and worked with TreeMap and TreeSet for ordered collections. I also began developing Weathery, a React-based weather app that fetches real-time data. Later, I practiced exception handling using try-catch-finally and custom exceptions to manage runtime errors. The week concluded with a Java test, where I performed well, and further progress on Weathery's UI and data integration, with deployment planned soon.

3.1.5 Week 5: Strengthening Java Web Development and Advancing React Projects

In the fifth week, I enhanced my front-end and Java-based web development skills. I started with jQuery, simplifying DOM manipulation and event handling, and used it to

create a weather app with the OpenWeather API in React. I then explored the integration of JavaScript, HTML, CSS, jQuery, DataTables, and Select2 for dynamic table sorting, pagination, and enhanced dropdowns. My training progressed to Java Servlets, where I learned request and response handling, session management, and the servlet lifecycle to improve client-server communication. I also mastered JSP (JavaServer Pages) for dynamic content generation and JavaScript DOM events for user interaction handling. Alongside my training, I worked on developing a React-based ChatBot to handle user input dynamically and refined my JavaScript skills, focusing on closures, promises, and event delegation, making significant progress on the ChatBot project.

3.1.6 Week 6: Advancing Java Proficiency and Building Real-Time React Applications

In Week Six, I strengthened my backend skills and expanded my experience with Java frameworks and real-time applications. I started with Java Database Connectivity (JDBC), learning to establish database connections, execute SQL queries, and handle exceptions effectively. I then worked on ChatNest, a chatbot built using Vite and the Gemini API, enabling real-time user interactions and dynamic responses. Next, I explored the Struts Framework, gaining insight into MVC architecture, action classes, and configuration files to streamline request handling and business logic. I also implemented DOM-based use cases, creating a dynamic website using JavaScript and integrating authentication. The highlight of the week was the successful deployment of NodeSurge, a productivity-focused platform offering advanced text tools, to-do lists, and real-time weather updates, with all core features functioning smoothly.

3.1.7 Week 7: Documentation, Evaluation, and Advancing Frontend Projects

In Week Seven, I focused on completing key internship documentation, including logbook approvals, reports, and preparing for the mid-evaluation. I successfully delivered the evaluation presentation, reflecting on my contributions so far. Post-evaluation, I shifted focus to frontend development by learning Next.js, understanding its file-based routing, server-side rendering, and differences from React. I applied these learnings by starting a new project and enhancing my web development skills. Later in the week, I developed and deployed two React-based applications: PassKey, a password generator focusing on algorithmic logic

and form handling, and Currex, a currency converter that utilizes real-time APIs and custom hooks for live exchange rate calculations. Both projects are live and mark significant growth in frontend proficiency.

3.1.8 Week 8: Deep Dive into Next.js and Web Optimization

In Week Eight, I advanced my web development skills through intensive hands-on work with React and Next.js. I began by resolving real-world UI issues, refining API interactions, and improving performance with optimized state management using React Hooks. Midweek, I enhanced my NodeSurge application by introducing categorized task management and enriched text tool functionalities, while also contributing to IEEE research paper documentation, focusing on structure and compliance with publication standards. I then built dynamic Next.js applications to explore file-based routing, server-side rendering, and API integration. One project involved a prediction page using Agify, Genderize, and Nationalize APIs, which sharpened my asynchronous data handling and state persistence techniques. The week concluded with mastering advanced features like `getServerSideProps`, `getInitialProps`, and global state management using Context API and Redux Toolkit—solidifying my understanding of modern SSR strategies and scalable frontend architecture.

3.1.9 Week 9: Full-Stack Development and Deployment with Next.js

In Week Nine, I focused on building and deploying a full-stack application using Next.js. I began by exploring tools like EmailJS to enable frontend email sending and implemented a modular alert system using Context API and custom hooks for improved UX. Midweek, I delved deeper into Next.js architecture, understanding server-client separation, data fetching strategies, and SEO practices while initiating the Promptlytic project—a platform for discovering and sharing AI prompts. I integrated authentication using NextAuth.js and MongoDB but faced issues with session handling, which I resolved before deploying the app using Vercel. This process gave me practical exposure to environment configuration, dynamic routing, and serverless deployment. I concluded the week with extensive testing and UI refinement, ensuring Promptlytic was user-ready, bug-free, and optimized for future enhancements.

3.1.10 Week 10: Launch Planning and Parallel Project Management

In Week Ten, I initiated the development of a new full-stack website while simultaneously contributing to my major academic project. The week began with project architecture setup using Next.js and backend planning involving MongoDB and API structures. I researched domain providers like GoDaddy, Namecheap, and Hostinger to prepare for eventual deployment. Midweek involved balancing my personal project progress with collaborative efforts in finalizing and debugging our academic project ahead of its evaluation. I implemented protected routes, refined database schemas, and rehearsed technical presentations with my team. As the week concluded, both projects saw final optimizations—my web app was deployment-ready, and our major project was fully tested and prepared for presentation.

3.1.11 Week 11: Ticket-Based Development and Conditional Logic Handling

In Week Eleven, I balanced progress on my personal full-stack website with active participation in ticket-based professional development tasks. The week began slowly due to network issues, limiting productivity. However, I soon transitioned to working on Ticket TICK:55636, focused on improving wishlist behavior by ensuring existing wishlist items trigger an option display instead of removal. Midweek, I implemented role-based logic to hide PO fields for consumer users, involving multiple iterations and backend validation under Ticket TICK:114503. This required debugging sessions, code reviews, and collaboration via calls for clarity. All work was done through isolated Git branches to maintain codebase integrity. By week's end, the fixes were stable, tested, and ready for final review.

3.1.12 Week 12: UI Performance Optimization and Code Refinement

Week Twelve focused on enhancing front-end stability and performance across ongoing projects. The primary challenge addressed was layout shift and image flickering within carousel components during promotion updates. After identifying lazy loading as a contributing factor, I experimented with image load strategies and began decoupling promotional state from carousel rendering logic. Midweek, I ensured carousel updates were isolated from unrelated UI components such as "Recently Viewed," minimizing re-renders.

Later, I gained clarity on the use of dynamic imports in Next.js and how improper placement could affect bundle size. I applied this knowledge by restructuring imports to enable on-demand loading. The week closed with continued refinement and testing, confirming noticeable UI improvements and setting up for final optimization validations in the following week.

3.1.13 Week 13: UI Fixes, Ticket Optimization, and Task Investigation

Week Thirteen focused on resolving UI issues and preparing clean, production-ready pull requests. I started by fixing a bug that caused the Track Order modal to appear unnecessarily for logged-in users, ensuring logic was updated and tested locally. Subsequent work involved isolating this fix in a clean pull request for Ticket TICK:129874, ensuring minimal changes with no unrelated diffs. Midweek, I began exploring a task related to Web Order number tracking, identifying logic gaps and dependencies that required further clarification. Thursday marked a public holiday (May Day), and Friday was spent partially progressing on the Web Order feature and completing internal training modules to deepen my understanding of the codebase and deployment architecture.

3.1.14 Week 14: Parallel Execution, Filter Logic Enhancement, and Feature Integration

Week Fourteen involved balancing my academic project with internship tasks, focusing on integrating the WebOrder filter for Ticket TICK:129874. After reviewing the ticket and seeking clarification through a technical call, I implemented logic to dynamically render search filters based on whether the `contract_name` includes “indoff.” I updated the `SEARCH_BY_OPTIONS_INDOFF_CONTRACT` constant to map WebOrder to `webOrderNumber`, tested the logic locally, and ensured it triggered only under the correct contract conditions. A clean branch and PR (6027) were created with minimal, focused changes—avoiding unnecessary formatting diffs. I updated the ticket with detailed comments, changed the status to “Code Review Pending,” and collaborated closely with the reviewer to walk through the logic. After the PR was approved and merged, I performed post-merge regression testing to ensure no other filter behaviors were affected. Final validation with the service team confirmed the feature’s correctness and stability, marking the task as successfully completed and deployed.

3.1.15 Week 15: Report Preparation

In Week Fifteen, I focused solely on preparing the final report. This involved compiling detailed summaries of weekly activities, organizing technical documentation, and refining content for clarity and coherence. I reviewed all prior work to ensure accuracy and completeness, formatted the report according to the required guidelines, and structured it to reflect a logical progression of the internship experience.

Chapter 4

Reflection Notes

4.1 Experience

Being an intern at Global Industrial was an enriching and transformative experience. Over the 13-week period, I developed a strong foundation in full-stack development, focusing on technologies like React, Next.js, Java, Firebase, and the Gemini API. I contributed to both personal and team projects including ChatNest, NodeSurge, Weathery, and Promptlytic—each enhancing my understanding of real-time data handling, authentication, and deployment strategies. I also contributed to ticket-based development work by resolving UI bugs and implementing feature logic, such as wishlist behavior and role-based access control, where my changes were successfully merged into the main codebase. These experiences helped me understand software development lifecycle practices, from branching strategies to production-ready pull requests.

4.2 Technical Outcomes

- **Frontend Backend Proficiency:** Gained expertise in building responsive user interfaces and scalable backend systems using React, Next.js, Java, and MongoDB.
- **Real-Time Projects:** Built and deployed apps like ChatNest (chatbot), NodeSurge (productivity tool), Weathery (weather tracker), and Promptlytic (AI prompt sharing).
- **Java Ecosystem:** Got to know basic Java concepts such as OOP, collections, exception handling, Servlets, JSP, JDBC, and explored MVC with the Struts Framework.

- **Code Management:** Worked with Git for version control, contributing clean and optimized code through ticket-based development and code reviews.
- **API Integration Optimization:** Enhanced skills in working with APIs and optimizing performance through state management and lazy loading in Next.js.
- **Version Control:** Learnt how to use version control systems like Git and platforms like Bitbucket to manage and collaborate on code files.

4.3 Non-Technical Outcomes

- **Communication Collaboration:** Improved collaboration skills through meetings, ticket discussions, and mid-evaluation presentations.
- **Problem-Solving:** Developed the ability to debug efficiently and adapt to new challenges, both independently and in team settings.
- **Time Management:** Balanced multiple projects and deadlines, including academic responsibilities, while maintaining code quality.
- **Professionalism:** Developed a professional attitude and work ethic, including punctuality, reliability, and accountability in meeting project commitments.
- **Confidence:** Gained confidence in handling real-world development challenges and working in a professional environment.
- **Continuous Learning:** Cultivated a mindset of continuous learning and improvement, staying updated on the latest design trends, tools, and technologies.
